

Double Pane Hurricane Resistant Windows

Each of our apartments has had its original windows replaced with Twin Pane Hurricane Resistant Windows. There is space between these window panes that has high insulation qualities and provides maximum insulation for your physical comfort and your financial benefit. The double panes contribute to keeping your electric bill as low as reasonable by essentially providing extra insulation over regular single pane windows.

Our residents indicate they believe these windows contribute to keeping their electric bill lower about \$10-\$30 per month depending upon how the Thermostat is set.

In addition, these windows help to dramatically reduce outside noises from entering your apartment and contribute to your satisfaction by giving you a quieter apartment.

We understand these windows also help during potential heavy winds such as thunderstorms or hurricanes. These windows will not break into sharp shards as a car window can...they may crack or shatter upon a strong impact, but they will withstand the force of 150mph wind. This means that an object being carried by 150mph wind will not penetrate that window.

Please compare our windows to any other apartment community you are considering and we trust you will see how much better are windows are for you.
